CSE 394- Spring 2016
In-Class: Lab 4
15 Points (Due: Tuesday 16ᵗʰ 11:59 pm)

Objectives:
  a) Further enhance the knowledge about using storyboard to develop multi-view iPhone apps using table views

Lab: During this lab, we will develop a simple table view application where the main view will have list of places you have visited (have at least five places). Once user selects a place, app should go to the detail view. The detail view should show the name of the place selected, a picture of the place, and a small description (one sentence is sufficient)

Also, you should be able to delete places in your App.

Requirements: You need to follow the design/implementation structure similar to the addressBookV1 that we have discussed in the class. Later we will extend this lab to homework #2. No need to have CoreData. You can store places and name of images of the places in arrays.

Submission Instructions
Submit online to the blackboard using the link given under Lab4
